<p>(54) Title: METHOD AND APPARATUS FOR DETECTING ELEVATOR ROPE DEGRADATION USING ELECTRICAL OR MAGNETIC ENERGY</p> <div data-bbox="347 1201 1261 1560" data-label="Image"> <p>The diagram shows a cross-section of a rope assembly. It consists of three main horizontal layers. The top layer is labeled 306 and contains a series of small rectangular elements. The middle layer is labeled 302 and contains a series of circular elements with internal cross-hatching. The bottom layer is labeled 308 and also contains a series of small rectangular elements. A central horizontal line runs through the middle of the assembly, labeled 310. A lightning bolt symbol labeled 300 points towards the top layer. A bracket on the right side of the middle layer is labeled 304.</p> </div> <p>(57) Abstract</p> <p>A method and system for detecting or measuring defects in a rope having ferromagnetic tension members includes a magnetic field exciter and an array of magnetic flux sensors corresponding to the tension members in a known relationship. Measurements of magnetic flux leakage are indicative of defects. Another aspect of the invention includes a method and system for detecting or measuring defects in an elevator rope having electrically conductive tension members, whereby measured electrical resistance in the tension members is indicative of defects.</p>		

INTERNATIONAL SEARCH REPORT

International Application No

PC1, JS 00/07279

A. CLASSIFICATION OF SUBJECT MATTER
IPC 7 G01N27/82

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 G01N

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

WPI Data, PAJ, EPO-Internal

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US 00/07279

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

1-4, 6-20

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. Claims: 1-4,6-20

A method and apparatus for detecting degradation of a rope applying a magnetic field.

2. Claim : 5

A methode for approximating tension-load bearing capacity of a rope by applying a magnetic field.

3. Claims: 21-31

A method for approximating the tension-load-bearing capacity of a rope applying a electric current.

4. Claim : 32

A monitoring system for monitoring the level of exitation of an elevator.

WHAT IS CLAIMED IS :

- 1) A method of detecting degradation of a rope comprising a plurality of ferromagnetic cord members, said method comprising
applying a magnetic field to a portion of said cord members;
monitoring magnetic flux associated with said magnetic field; and
5 identifying locations along said cord members exhibiting magnetic flux leakage, wherein said locations are indicative of degradation.
- 2) A method according to claim 1, wherein
said magnetic field is applied by relative movement between said rope and a magnet.
- 3) A method according to claim 1, wherein
said rope comprises a body of non-ferromagnetic insulator material having a generally rectangular cross-section in which said plurality of ferromagnetic cord members are distributed and extend longitudinally
5 therewith.
- 4) A method of detecting and locating degradation of a rope comprising a plurality of ferromagnetic cord members, said method comprising
causing said rope to move at a known rate relative to a magnet in order to apply a magnetic field to a portion of said cord members;
5 monitoring magnetic flux associated with said magnetic field as a function of time; and
identifying points in time in which said cord members exhibit magnetic flux leakage, wherein said points in time are indicative of the location of rope degradation.
10
- 5) A method for approximating tension-load bearing capacity of a rope comprising a plurality of ferromagnetic cord members, said method comprising
applying a magnetic field to a portion of said cord members;
measuring magnetic flux associated with said magnetic field; and
5 comparing said measured magnetic flux leakage to predetermined data indicative of tension-load bearing capacity.

- 6) A method of detecting and locating degradation of a rope comprising a plurality of ferromagnetic cord members, said method comprising
applying a magnetic field to a portion of said cord members;
monitoring magnetic flux associated with said magnetic field;
5 identifying locations along each individual cord member exhibiting magnetic flux leakage, wherein said locations are indicative of degradation; and
correlating said locations indicative of degradation of individual cord members with respect to each other to determine relative locations
10 of each.
- 7) A method according to claim 3, further comprising
measuring the magnitude of said magnetic flux leakage.
- 8) A method according to claim 4, further comprising
measuring the magnitude of said magnetic flux leakage.
- 9) A method according to claim 6, further comprising
measuring the magnitude of said magnetic flux leakage.
- 10) An apparatus for detecting and locating degradation of a rope having at least one ferromagnetic component, said apparatus comprising
a body comprising rope guide means for guiding said rope along
said body;
5 a magnet fixed with respect to said body for establishing a magnetic field adjacent to said body;
magnetic flux sensing means mounted with respect to said body for monitoring magnetic flux associated with said magnetic field; and
means for correlating said magnetic flux with said rope to
10 determine one or more locations of degradation.
- 11) An apparatus according to claim 10, wherein
said rope comprises a plurality of ferromagnetic cord members.

12) An apparatus according to claim 11, wherein
said magnetic flux sensing means comprise a plurality of magnetic
flux sensors mounted to said body.

13) An apparatus according to claim 12, wherein
said magnetic flux sensors comprise Hall effect transducers.

14) An apparatus according to claim 12, wherein
said plurality of magnetic flux sensors each correspond to one of
said ferromagnetic cord members such that each magnetic flux sensor
monitors the magnetic flux of a respective one of said cord members.

5

15) An apparatus according to claim 14, further comprising
control means for correlating the magnetic flux detected by each of
said magnetic flux sensors.

16) An apparatus according to claim 14, wherein
said plurality of magnetic flux sensors are positioned with respect to said
body so that they remain on one side of said rope when it is guided along said
body.

5

17) An apparatus according to claim 14, wherein
said plurality of magnetic flux sensors are positioned with respect to said
body so that they are on opposing sides of said rope when it is guided along
said body.

5

18) An apparatus according to claim 10, further comprising
means for mounting said apparatus in an elevator assembly in
such a manner as to enable it to engage an installed elevator rope with
said rope guide means for detecting and locating degradation of said
elevator rope.

5

- 19) An apparatus according to claim 10, further comprising
means for mounting said apparatus to an elevator hoist machine
assembly in an elevator assembly in such a manner as to enable it to
engage an installed elevator rope with said rope guide means for
5 detecting and locating degradation of said elevator rope.
- 20) An apparatus according to claim 10, wherein
said apparatus is a self-contained, portable unit adapted to be
transported to and from an elevator assembly for use therewith to enable
it to engage an installed elevator rope with said rope guide means for
5 detecting and locating degradation of said elevator rope.
- 21) A method for approximating the tension-load bearing capacity of an elevator
rope comprising an electrically-conductive, tension-bearing component, said
method comprising
5 applying an electric current through said elevator rope ;
determining electrical resistivity of said elevator rope ; and
comparing said resistivity to predetermined data indicative of
tension-load bearing capacity of said elevator rope.
- 22) A method according to claim 21, further comprising
connecting current input and current output leads at dead-end
hitch points, respectively, of said elevator rope in an elevator assembly.
- 23) A method according to claim 21, wherein
said electrically-conductive component is a tension-bearing cord in
an elevator rope, wherein said tension-bearing member supports the load
of the elevator car.
5
- 24) A method according to claim 21, wherein
said elevator rope further comprises a non-conductive insulating
jacket generally surrounding said electrically-conductive, tension-bearing
component.
5

- 25) A system for approximating tension-load bearing capacity of an elevator rope having two fixed ends in an elevator assembly and comprising an electrically-conductive component, said system comprising
- 5 means for applying electric current through a section of said elevator rope ;
- means for measuring electrical resistivity of said elevator rope ;
- and
- means for correlating said measurement of said resistivity to predetermined data indicative of tension-load bearing strength of said
- 10 elevator rope.
- 26) A system according to claim 25, wherein
- said electrically-conductive component is a tension-bearing member cord in an elevator rope, wherein said tension-bearing member supports the load of the elevator car.
- 27) A system according to claim 25, wherein
- said elevator rope further comprises a non-conductive insulating jacket generally surrounding said electrically-conductive, tension-bearing component.
- 5
- 28) A system according to claim 25, wherein
- said electrically-conductive, tension-bearing component of said elevator rope comprises a plurality of cords embedded within and running longitudinally along the length of said elevator rope for supporting the
- 5 load of an elevator car; and
- said means for applying electric current through a section of said elevator rope engage each of said cords to apply electric current therethrough.
- 29) A system according to claim 25, further comprising
- means for engaging said two fixed ends of said elevator rope for applying said electric current through said elevator rope.

30) A system according to claim 25, further including
means for comparing said measurement of said resistivity for each
cord with the others and determining the relative tension-load bearing
strengths of each with respect to the others.

5

31) A system according to claim 28, wherein
said elevator rope further comprises a non-conductive insulating
jacket generally surrounding said plurality of cords.

32) A monitoring system for monitoring the level of excitation of an elevator
rope having a load-bearing element that supports the tension loads of the
elevator system and a jacket that encompasses the load-bearing element, said
monitoring system comprising

5

excitation means for exciting said load-bearing element in a
manner such that said jacket is not subject to excitation; and
monitoring means for monitoring the level of excitation of said
load-bearing element.
